

Highlights

- **Helps to achieve process automation in small, midsize, and large enterprises through the use of intelligent, self-rendering forms**
- **Engages users in global markets with electronic forms support in 10 languages**
- **Speeds forms creation through simple one-click operations and reusable components that include business rules**
- **Enhances productivity through innovative “design once, use on any device” approach**
- **Facilitates compliance with record-keeping requirements, providing auditable forms that help ensure an accurate record of electronic transactions**
- **Reduces time, errors and costs for form completion through wizard-based forms**
- **Offers flexible forms deployment options — mobile, rich client, or zero footprint clients, on-line and off-line operation**
- **Integrates with any system through standards-based web service**

pointCheck™ Software

To increase operational speed, an organization must move beyond processes built around paper-based forms. Instead, businesses must build *data-aware electronic forms* — forms that meet the processing and data requirements for highly efficient business processes. Forms that adapt to processes, rather than the other way around.

With pointCheck™, you can reduce the time, costs and problems that come with processing paper-based forms. You get intelligent, easily-built electronic forms that work easily with your existing systems so you can automate processes from start to finish, better serve customers and empower everyone to work more efficiently. And you can use these forms whenever and wherever you work: in the office, on the field, on the road, absolutely anywhere.

By automating information capture and processing, pointCheck helps you reduce the need for manual intervention and exception handling, as well as minimize the errors that often result from manual, paper-based processes. With automatic information capture and processing, you can truly achieve a “once and done” process with straight-through transaction processing.

Forms that work the way you work

pointCheck™ provides more than simple electronic representations of paper forms. Instead, this software uses intelligent self-rendering forms that allow you to work the way you see fit: with a mobile device, a web browser, or a desktop computer.

pointCheck™ includes:

- *pointCheck™ PocketPC, pointCheck™ Office, and pointCheck™ User — Clients (for Pocket PCs, Microsoft Office, and web browsers respectively) used for filling in forms.*
- *pointCheck™ Administrator, and pointCheck™ Reports — Web-based applications used for configuration and form creation, and report generation, respectively.*
- *pointCheck™ WebService, and pointCheck™ OfficeScheduler — Services for interfacing with other systems, and production and processing of off-line Microsoft InfoPath forms.*

pointCheck Clients

With intuitive, yet simple interface, and user defined instructions for every form and every field, pointCheck helps users complete forms more easily, with fewer errors and greater speed.

Because pointCheck clients are available for mobile devices, web browsers, and Microsoft InfoPath, users can use different clients depending on the type of form they are filling in, or the type of work they are performing. pointCheck makes all forms available for all different types of clients, allowing for on-line or off-line usage, effectively providing freedom for users to work the way they want.

Client-side validation of information helps speed form completion. And once complete, forms can be routed in a variety of ways, including through e-mail or existing workflows.

pointCheck Configuration & pointCheck Reporting

pointCheck provides a single, standardized development platform makes it possible for diverse project teams to work together more closely, from forms designers to business analysts to data architects. No matter what kind of information you want to capture, pointCheck enables you to create your forms easily, in 10 different languages, without worrying about their layout on every different device.

With pointCheck, you can significantly reduce the time to create new forms. Forms designers can use existing objects, enable client- and server-side validation, and define alerts for every single piece of information collected. And, once designed, a single form can be displayed by a variety of mobile, web, and rich clients.

pointCheck also includes a number of predefined reports, as well as a report generator to facilitate the creation of new reports, in a consistent “no programming skills needed” approach.

pointCheck Services & Integration

pointCheck facilitates the interfacing with other systems, processes, and workflows through a standards-based web service. Not only data can be pulled from the system, but the web service allows the programmatic creation of forms, enabling you to automatically generate forms, the moment they are needed.

Apart from the integration facilitation, pointCheck also provides a way to create Microsoft InfoPath forms so that users can work off-line. These forms include all security information needed to ensure that they are only used by the people they are intended for.
